

Kithara DOS Enabler—The Return of a Classic

One must not assume that the good old DOS has already disappeared from the industrial sector. It is still very much appreciated as a cost-efficient and reliable operating system in many fields, where it is successfully applied, for example, in highly specialized hardware-dependent programs.

The eagerly awaited remake of Kithara DOS Enabler ties in with the success of its predecessor, brings it up to date and makes it available for Windows 7/8/10 on 32/64-bit systems. The performance stability and faithful conversion that is true to the original are based on the unique functionality of Kithara DOS Enabler.

Simple virtualizations more than often are accompanied by performance loss and stability issues and thus are hardly suitable for crucial industrial applications. Kithara DOS Enabler, on the

other hand, uses the multi-core CPU technology of today's computers in order to run a native, lossless DOS on a single core and in a single window. By eliminating any negative interference by Windows, even time-critical tasks can be accomplished.

The result is a pure DOS environment, which is able to fulfil industrial requirements while also allowing for emulated or even direct I/O access to the hardware. For professional applications on modern operating systems such as Windows, Kithara DOS Enabler represents the only practicable solution.
